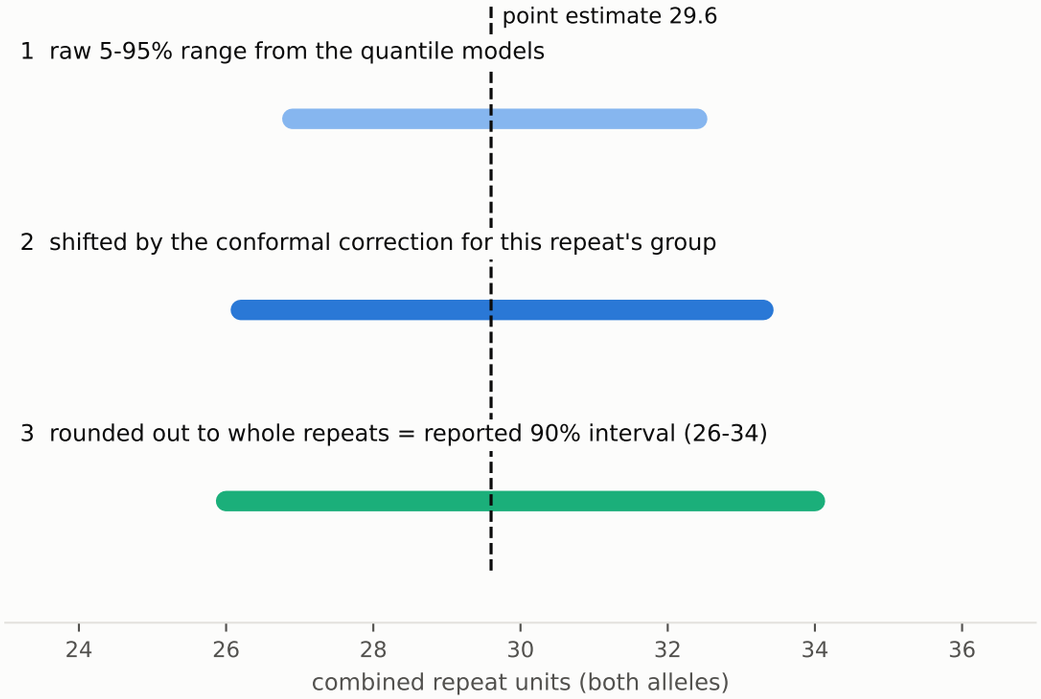
How the model was trained and checked, and how the interval and tier are built

Box sizes are schematic, not to scale; grey = not used.
People are split by family (relatives never cross groups); repeats by a fixed hash.
Model estimates for training people used inside the model are cross-fitted (5 folds).

Example: building one call's 90% interval



Tier for this call: PASS, because the interval width (34 - 26 = 8) is no larger than the estimate (29.6) and the repeat is not in the top 10% of the novelty score. Otherwise LOW_CONF; NA when the repeat could not be read.
